

# NAVIS - Project Summary

## Description

Navis is an AI-powered public transport navigation system that recommends routes based on multiple factors such as time, cost, comfort, crowd level, user preferences, and route risk indicators. Instead of only suggesting the shortest or fastest path, Navis helps users make better travel decisions by providing personalized and explainable route recommendations.

## Key Features

- Smart route recommendation
- Personalized route selection (fastest, cheapest, most comfortable, etc.)
- Fare estimation
- Crowd level prediction
- Destination proximity alerts
- Route confidence score
- Explainable route recommendations
- Route deviation detection
- Offline-friendly support
- Route Risk Indicator (crime, accident, and other risk notices)

## How Navis Differs from Existing Navigation Tools

- Existing apps mainly focus on travel time and distance.
- Navis considers time, cost, comfort, crowd levels, transfers, and user preferences.
- Existing apps rarely provide crowd-awareness and travel comfort insights.
- Navis explains why a route is recommended.
- Navis provides route risk notices instead of blindly optimizing for speed.
- Navis acts as a travel decision assistant rather than just a navigation tool.
